

Circuit Breaker Overview

We've added a circuit breaker in our carts that will allow them to protect themselves from any current spikes found within the system. These spikes would only happen in extreme cases and the breaker can easily be reset in seconds.

A user would be able to tell that the circuit has been tripped if the cart will no longer raise or lower. The user can reach underneath the right side of the cart and press the button in to reset the circuit. This will return the cart to a functional electric lift mechanism.
